

Oshkosh 2012 Pedal Stearman

The Stearman was a very popular military trainer. The round engine, exposed cylinders give this toy distinct features. Fuselage and wings are constructed from 3/8" plywood and the engine case of 3/4" pine which is glued and turned to shape. The cylinders are made of pvc pipe. A adjustable pedal crankshaft assembly allows for a growing pilot and the joystick turns the plane by linkage to the tailwheel. The pedals also turn the prop assembly by use of a rubber drive belt.

Your 3 to 7 year old can achieve new heights of fun with this pedal plane.

A reduced set of plans are available for kit builders and a full size set of piece part drawings are available for the scratch builder. We have added many photos to help speed up and simplify the assembly process.

We also offer a complete set of kits to help speed up the build process.

The kits can also be purchased together to make a complete parts kit or in sub kits to give the builder choices. Order forms included with both choices of plan packages.
